

Flea Treatment & Service Guide

By Technician: Ezequiel Becerril

◆ What You Get with Today's Service

- **Initial Treatment** – Targets adult fleas currently active in your property.
- **Follow-Up (1 Week Later)** – Reinforces the first service, hitting fleas that were in the pupal (cocoon) stage and are just now emerging.

■ Why Monthly Service is Key

Fleas have a 4-stage life cycle:

1. Eggs ■ 2-10 days	Laid on pets or carpets, fall into cracks and fabrics. Hatch quickly in warm, humid conditions.
2. Larvae ■ 5-20 days	Hide deep in carpet fibers, feeding on organic matter. Avoid light and are hard to reach with treatments.
3. Pupae ■■ 1-2 weeks	The toughest stage! Protected in cocoons, fleas may survive weeks or months until vibrations, heat, or carbon dioxide trigger them to emerge.
4. Adults ■ 2-3 months	Jump onto pets and humans, bite, and reproduce quickly. A single female can lay 20–40 eggs per day , restarting the cycle.

♦ How Often Can Services Be Done?

In California, **monthly pest control is the standard and most effective schedule.**

- Treatments **can be done sooner (e.g., every 2 weeks)** if the infestation is heavy.
- Regulations allow for flexible scheduling as long as **pesticide label directions are followed.**

♦ What You Can Do at Home

- **Vacuum daily** (dispose of bag/contents right away).
- **Wash pet bedding** in hot water weekly.
- **Use veterinarian-approved flea control** for pets.

♦ Our Recommendation

- ✓ One-time service + 1-week follow-up (included).
- ✓ **Ongoing monthly service** for 3–6 months to fully eliminate fleas.
- ✓ After that, switch to **preventive monthly treatments** to stay flea-free.

With Bug Sheriff Pest Control, You're Protected

We're here to help you win the battle against fleas—safely, effectively, and consistently.
